Feature Context: Active/Inactive Filter

Version: 1.0

1. Feature Description

The goal is to add a primary filter to the top of the sidebar that allows the user to toggle the visibility of plugins based on their active status (a boolean field in the JSON data).

2. User Story

As a user, my default view should only show my currently active plugins. However, I want a simple way to include inactive or archived plugins in my search when I am researching tools I own but do not currently have installed.

3. Core Requirements

- **UI Element:** A single checkbox or a toggle switch labeled "Show Inactive" will be added to the sidebar.
- **Positioning:** This filter must be the first element in the sidebar, placed directly below the text search input and above the type filter group.
- **Default State:** The filter should be **unchecked** by default, meaning only plugins where active: true are shown on initial page load.
- **Filtering Logic:**
  - When the box is unchecked (default), only plugins with active: true should be included in the dataset that is passed to the other filters.
  - When the box is checked, all plugins (both active: true and active: false) should be included.
- **Interaction:** Toggling this checkbox must instantly trigger a re-filtering of the entire plugin grid.

4. Vibe & Aesthetic

- **Vibe:** "Primary Control". This is a master switch, and its function should be immediately obvious.
- **Styling:** The element will be styled to match the existing "Classic Pearl" / "Subscotia Dark" themes.
